

VINYL REMOVAL

Always heat the vinyl and the surrounding area, being careful not to burn the vinyl, surface or yourself. A heat gun or blow torch works well. A space heater, hair dryer, or even the sun can also work.

After heating try and lift a small area using your finger nail or small plastic scraper. Once the decal is started you can pull on it at a 45 degree angle and it should slowly lift, taking some or most of the adhesive with it. Only use a metal razor blade on glass.

Once you get the decal totally removed, an adhesive remover can be used to dissolve the glue left behind. Please call for further information on your specific application
